Assignment – 14.4

Ht.No: 2303A51584

Batch: 05

Task 1: Responsive Homepage Layout for a Startup Website

Scenario

You are designing a basic homepage for a startup company that needs to look good on desktops, tablets, and mobile devices.

Task Description

• Create a web page structure using HTML that includes:

• A header with navigation links

• A main content section

• A footer with basic information

• Use AI assistance to generate responsive CSS using media queries.

• Ensure the layout adjusts smoothly across different screen sizes.

Expected Output

• A responsive web page where:

• Header, content, and footer are clearly separated

• Layout adapts correctly to mobile, tablet, and desktop views

- Code is clean and well-structured

ABOUT US

Technology that simply works.

StartupCo was founded with one mission: to make technology more accessible. We believe great software should be invisible — it should simply work, letting people focus on what matters most.

Our team brings together decades of experience in design, engineering, and strategy to deliver products that are as beautiful as they are functional.

SERVICES

Everything you need to ship.

Task 2: Interactive Call-to-Action Button

Scenario

A marketing page requires a call-to-action button that responds when users interact with it.

Task Description

• Add a button to a web page using HTML.

• Use AI to generate JavaScript that responds to the button click by:

• Displaying a message or alert

• Ask AI to add meaningful comments explaining the JavaScript logic.

Expected Output

• A web page where:

• Clicking the button triggers a visible response (alert or message)

• JavaScript code is readable and commented

• No page reload occurs

Prompt:

Create a simple web page with a call-to-action button using HTML, CSS, and JavaScript. The button should look visually appealing with a good UI design (nice colors, spacing, and hover effect).

When the user clicks the button, JavaScript should trigger a response such as displaying an alert message or showing a message on the page. The page should not reload when the button is clicked.

Please add clear and meaningful comments in the JavaScript code explaining what each part of the logic is doing. Keep the code clean, simple, and easy to understand.

SERVICES

Everything you need to ship.

Product Design

From wireframes to high-fidelity prototypes, we craft interfaces that users love and remember.

Web Development

Fast, accessible, and responsive web applications built with modern technologies.

Strategy & Consulting

Data-driven insights to help you make the right product decisions at the right time.

Task 3: Contact Form with Client-Side Validation

Scenario

You are developing a contact form for a company website to collect user queries safely and correctly.

Task Description

• Design a form with fields for:

•Name

• Email

• Message

• Use AI to generate JavaScript validation logic that:

• Prevents empty submissions

• Checks for a valid email format

• Display clear error messages for invalid input.

Expected Output

• A functional form where:

• Invalid input shows inline error messages

• Valid input displays a success message

• Validation happens on the client side using JavaScript

Prompt:

Create a contact form for a company website using HTML, CSS, and JavaScript. The form should include fields for Name, Email, and Message. The design should look clean and user-friendly with a good UI layout.
Add JavaScript for client-side validation so that the form does not allow empty submissions and checks if the email is in a valid format. If the user enters invalid input, clear error messages should appear near the respective fields.
When all inputs are valid and the form is submitted, display a success message without reloading the page. Please keep the code simple, well-structured, and include comments in the JavaScript explaining the validation logic.

Task 4: Dynamic List Management for a Product Page

Scenario

A product listing page needs to add or remove items dynamically without refreshing the page.

Task Description

• Create a simple HTML list to display items.

• Use AI to generate JavaScript that:

•Adds a new item when an “Add” button is clicked

• Removes the last item when a “Remove” button is clicked

• Ensure the DOM updates dynamically.

Expected Output

• A web page where:

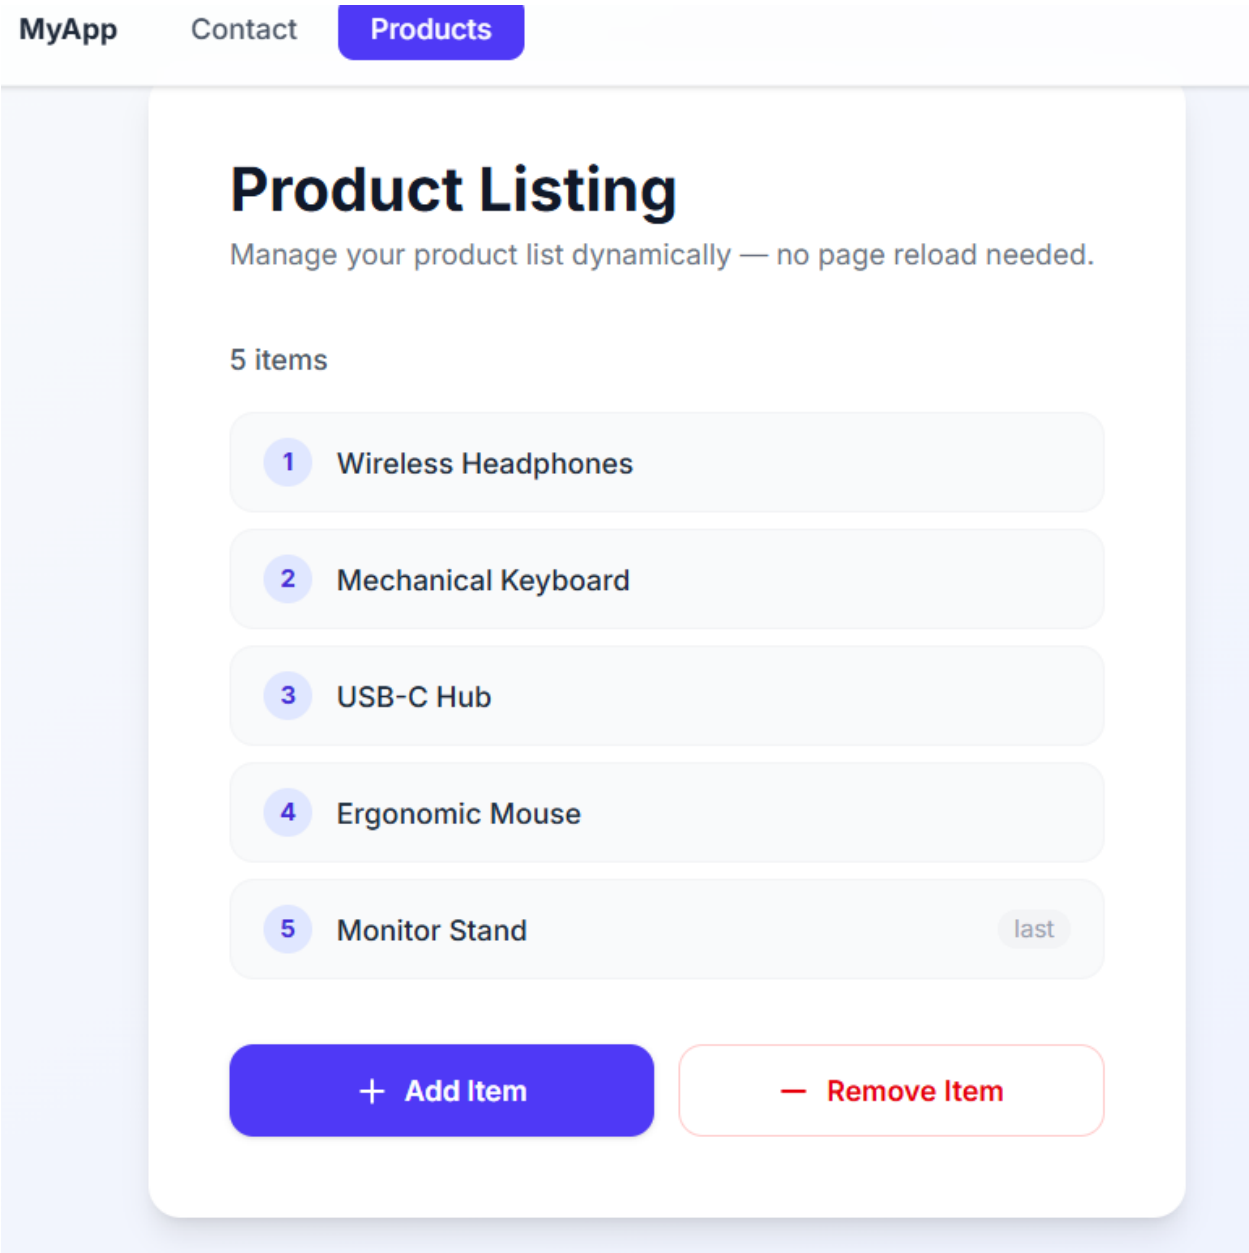
• Items can be added and removed dynamically

• Changes appear instantly without page reload

• JavaScript logic is clear and maintainable

Create a simple product list web page using HTML, CSS, and JavaScript. The page should display a list of items (like product names) and have two buttons: Add Item and Remove Item. The UI should look clean and visually appealing with good spacing, colors, and button styling.
Use JavaScript so that when the Add Item button is clicked, a new item is added to the list, and when the Remove Item button is clicked, the last item in the list is removed. The list should update dynamically using DOM manipulation without refreshing the page. Keep the code simple and well structured, and include comments in the JavaScript explaining how the add and remove functionality works.

Plan



MyApp

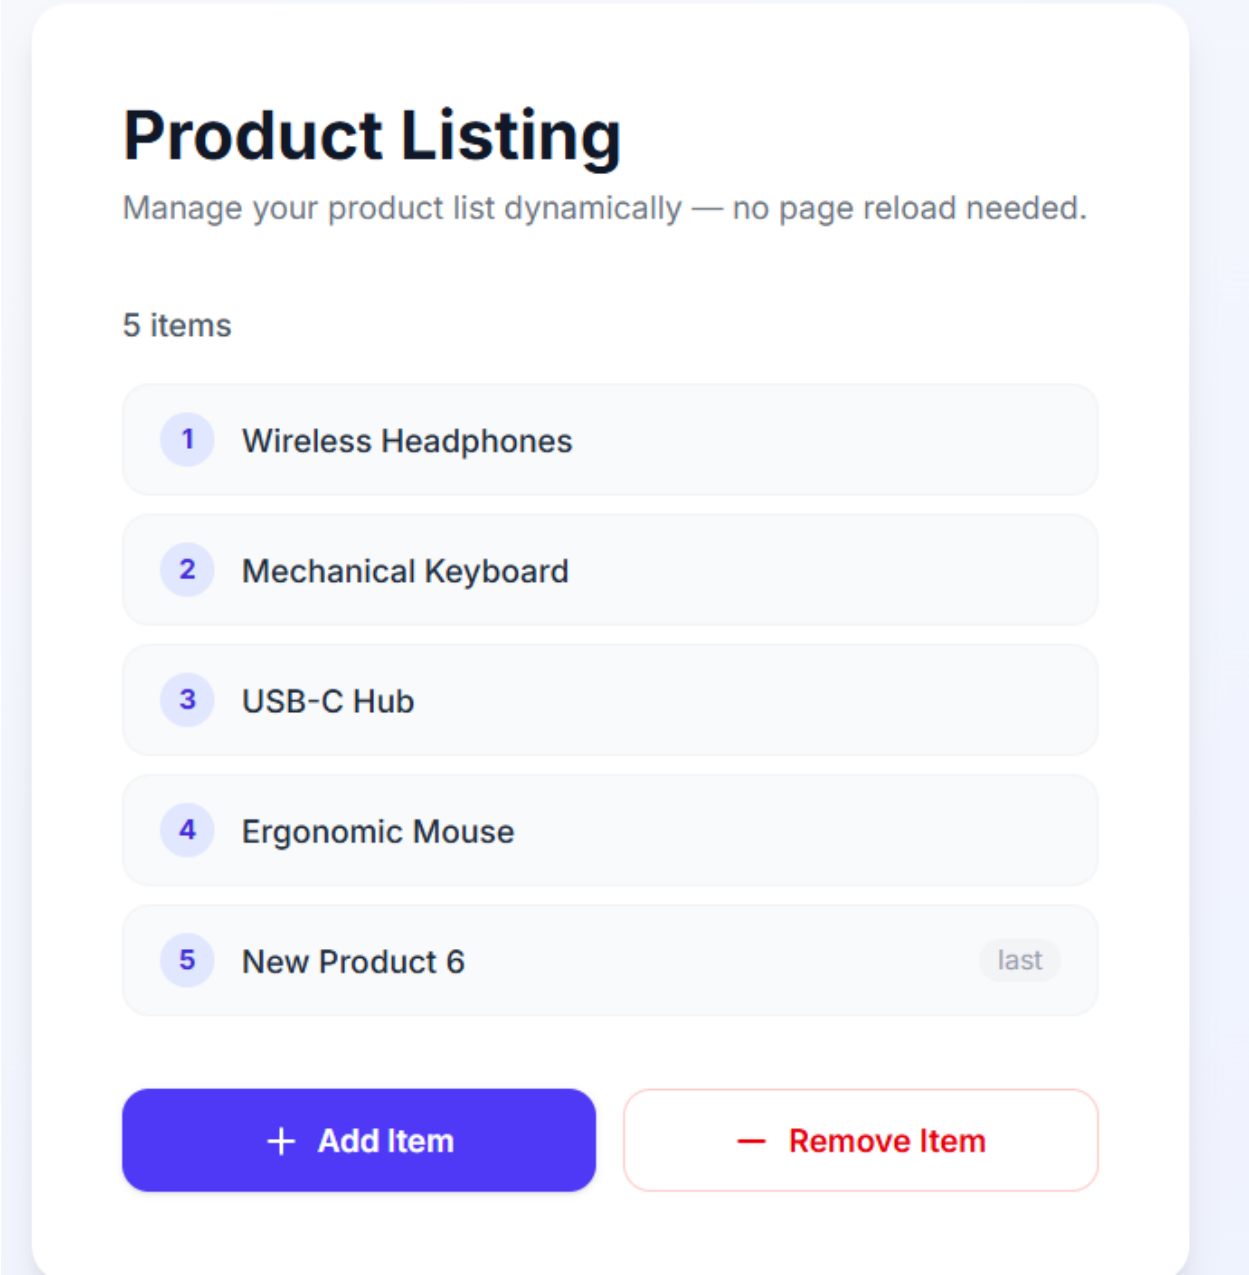
Adding item:



Task 5: Modal Popup for User Notifications

Scenario

You are building a user notification popup for announcements or alerts on a website.

Task Description

• Use AI to help generate:

• HTML structure for a modal popup

• CSS styling with a semi-transparent background overlay

• JavaScript to open and close the modal

• Include multiple ways to close the modal (button or overlay click).

Expected Output

• A web page where:

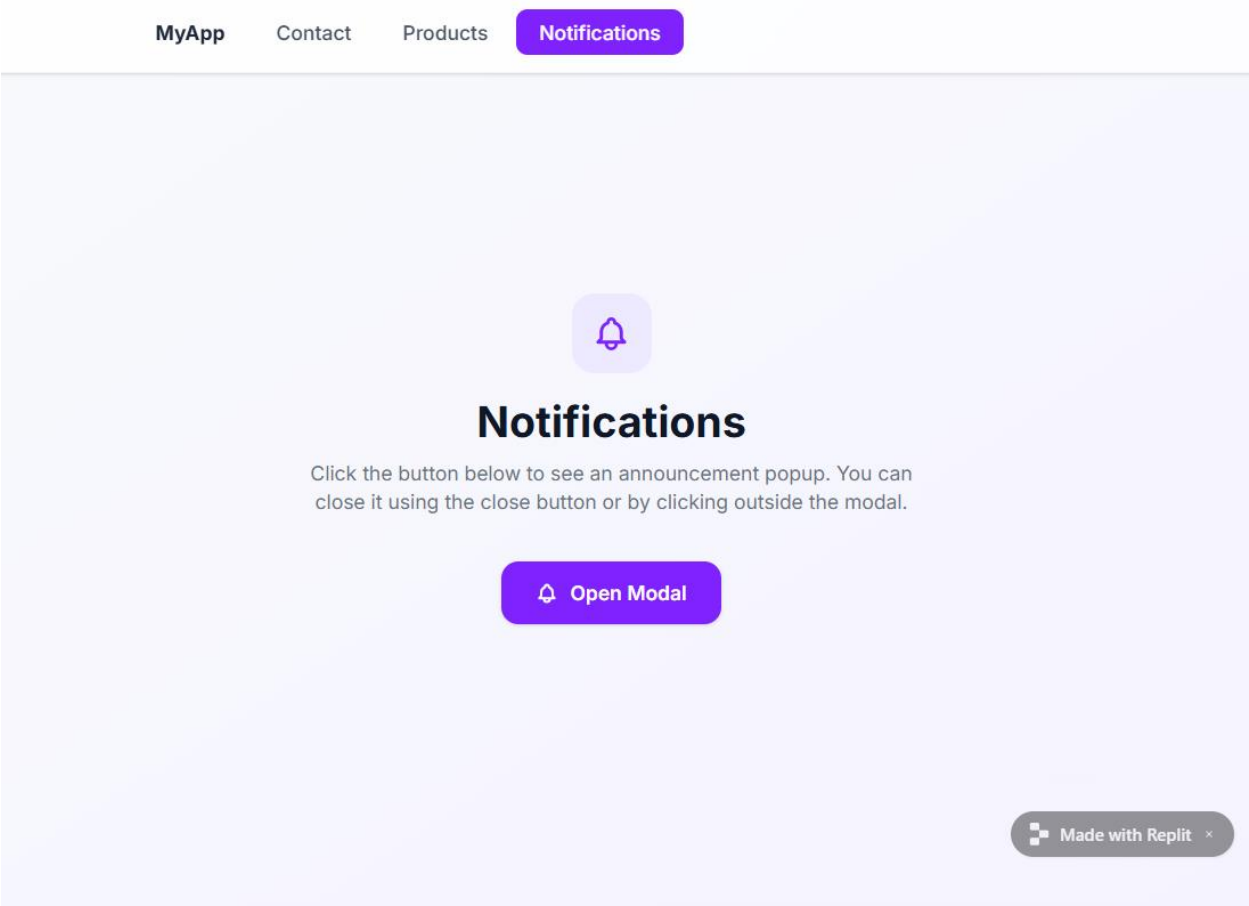
• Clicking “Open Modal” displays the popup

• Popup overlays the page content clearly

• Modal closes smoothly when instructed

Create a web page that includes a modal popup for showing user notifications or announcements. Use HTML for the modal structure, CSS for styling, and JavaScript to control opening and closing the modal. The UI should look clean and modern with a semi-transparent background overlay when the modal appears.
Add a button called "Open Modal" that displays the popup when clicked. The modal should contain some sample notification text and a close button. The modal should be able to close in multiple ways: by clicking the close button or by clicking outside the modal on the overlay. The popup should appear clearly over the page content and close smoothly.
Keep the code simple and well organized, and include comments explaining the JavaScript logic for opening and closing the modal.

Plan



MyApp
